### Review 2 for Exam 1.

- 5 or 6 problems.
- No multiple choice questions.
- No notes, no books, no calculators.
- Problems similar to homeworks, webwork.
- Exam covers:
  - Linear equations (2.1).
  - Separable equations (2.2).
  - Homogeneous equations (2.2).
  - Modeling (2.3).
  - Non-linear equations (2.4).
  - Bernoulli equation (2.4).
  - Exact equations (2.6).
  - Exact equations with integrating factors (2.6).

### Example

Find the integrating factor that converts the equation below into an exact equation, where

$$\left(x^{3}e^{y}+\frac{x}{y}\right)y'+(2x^{2}e^{y}+1)=0.$$

Solution: We first verify if the equation is not exact.

$$N = \left(x^3 e^y + \frac{x}{y}\right)$$

#### Example

Find the integrating factor that converts the equation below into an exact equation, where

$$\left(x^{3}e^{y} + \frac{x}{y}\right)y' + (2x^{2}e^{y} + 1) = 0.$$

Solution: We first verify if the equation is not exact.

$$N = \left(x^3 e^y + \frac{x}{y}\right) \quad \Rightarrow \quad \partial_x N = 3x^2 e^y + \frac{1}{y}$$

#### Example

Find the integrating factor that converts the equation below into an exact equation, where

$$\left(x^{3}e^{y} + \frac{x}{y}\right)y' + (2x^{2}e^{y} + 1) = 0.$$

Solution: We first verify if the equation is not exact.

$$N = \left(x^3 e^y + \frac{x}{y}\right) \quad \Rightarrow \quad \partial_x N = 3x^2 e^y + \frac{1}{y}.$$
$$M = \left(2x^2 e^y + 1\right) = 0$$

#### Example

Find the integrating factor that converts the equation below into an exact equation, where

$$\left(x^{3}e^{y} + \frac{x}{y}\right)y' + (2x^{2}e^{y} + 1) = 0.$$

$$\left(x^2 e^y + \frac{1}{y}\right) y' + \left(2x e^y + \frac{1}{x}\right) = 0.$$

Solution: The equation is exact. We need to find the potential function  $\psi$ .

$$\partial_{\mathbf{y}}\psi = \mathbf{N}, \qquad \partial_{\mathbf{x}}\psi = \mathbf{M}.$$

From the first equation we get:

$$\partial_y \psi = x^2 e^y + \frac{1}{y} \quad \Rightarrow \quad \psi = x^2 e^y + \ln(y) + g(x).$$

Introduce the expression for  $\psi$  in the equation  $\partial_x \psi = M$ , that is,

$$2xe^{y} + g'(x) = \partial_{x}\psi = M$$

The equation is not homogeneous. It is not exact.

Although the equation is both separable and Bernoulli, it is not simple to integrate using the separable equation method.

#### Example

Example

Find every solution y to the equation 
$$y' = -\frac{2x+3y}{3x+4y}$$
.

Solution: The equation is not linear, not Bernoulli, not separable. It is homogeneous. (Multiply numerator and denominator on the right hand side by (1/x).) Is it exact? (3x + 4y)y' + (2x + 3y) = 0 implies  $\partial_x N = 3 = \partial_y M$ . So the equation is exact.

We choose here the exact equation method. (Finding the potential function is sometimes simpler that solving homogeneous Eqs.)

We need to find the potential function  $\psi :$

### Definition

Given any two fundamental solutions  $y_1$ ,  $y_2$ , and arbitrary constants  $c_1$ ,  $c_2$ , the function

$$y(t) = c_1 y_1(t) + c_2 y_2(t)$$

is called the *general solution* of the differential equation above.

### Theorem (Constant coefficients)

Given real constants  $a_1$ ,  $a_0$ , consider the homogeneous, linear differential equation on the unknown  $y : \mathbb{R} \to \mathbb{R}$  given by

$$y'' + a_1 y' + a_0 y = 0. (1)$$

Let  $r_+$ ,  $r_-$  be the roots of the characteristic polynomial  $p(r) = r^2 + a_1 r + a_0$ , and let  $c_0$ ,  $c_1$  be arbitrary constants. Then, any solution of Eq. (1) belongs to only one of the following cases: (a) If  $r_+ \neq r_-$ , the general solution is  $y(t) = c_1 e^{r_+ t} + c_2 e^{r_- t}$ . (b) If  $r_+ = r_- \in \mathbb{R}$ , the general solution is  $y(t) = (c_1 + c_2 t)e^{r_+ t}$ . Furthermore, given real constants  $t_0$ ,  $y_1$  and  $y_2$ , there is a unique solution to the initial value problem given by Eq. (1) and the initial conditions

$$y(t_0) = y_1, \qquad y'(t_0) = y_2.$$

#### Example

Find the general solution of the equation y'' - y' - 6y = 0.

Solution: Since solutions have the form  $e^{rt}$ , we need to find the roots of the characteristic polynomial  $p(r) = r^2 - r - 6$ , that is,

$$r_{\pm} = rac{1}{2} \left( 1 \pm \sqrt{1+24} \right) = rac{1}{2} (1 \pm 5) \quad \Rightarrow \quad r_{+} = 3, \quad r_{-} = -2.$$

So,  $r_{\pm}$  are real-valued. A fundamental solution set is formed by

$$y_1(t) = e^{3t}, \qquad y_2(t) = e^{-2t}.$$

### Theorem (Complex roots)

If the constants  $a_1$ ,  $a_0 \in \mathbb{R}$  satisfy that  $a_1^2 - 4a_0 < 0$ , then the characteristic polynomial  $p(r) = r^2 + a_1r + a_0$  of the equation

$$y'' + a_1 y' + a_0 y = 0$$
 (2)

(日) (同) (三) (三) (三) (○) (○)

has complex roots  $r_+ = \alpha + i\beta$  and  $r_- = \alpha - i\beta$ , where

$$\alpha = -\frac{a_1}{2}, \qquad \beta = \frac{1}{2}\sqrt{4a_0 - a_1^2}.$$

Furthermore, a fundamental set of solutions to Eq. (2) is

$$\tilde{y}_1(t) = e^{(\alpha+i\beta)t}, \qquad \tilde{y}_2(t) = e^{(\alpha-i\beta)t},$$

while another fundamental set of solutions to Eq. (2) is

$$y_1(t) = e^{\alpha t} \cos(\beta t), \qquad y_2(t) = e^{\alpha t} \sin(\beta t).$$

One way to find the real-valued general solution is to find real-valued fundamental solutions.

### Second order linear homogeneous ODE.

- Review: On solutions of  $y'' + a_1 y' + a_0 y = 0$ .
- Characteristic polynomial with complex roots.
  - Two main sets of fundamental solutions.
  - A real-valued fundamental and general solutions.

► Application: The RLC circuit.

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ▶ ④ ●

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

- ロ ト - 4 回 ト - 4 □ - 4

Solution: Recall:  $y(t) = \tilde{c}_1 e^{(1+i\sqrt{5})t} + \tilde{c}_2 e^{(1-i\sqrt{5})t}$ ,  $\tilde{c}_1, \tilde{c}_2 \in \mathbb{C}$ .

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

Solution: Recall:  $y(t) = \tilde{c}_1 e^{(1+i\sqrt{5})t} + \tilde{c}_2 e^{(1-i\sqrt{5})t}$ ,  $\tilde{c}_1, \tilde{c}_2 \in \mathbb{C}$ .

The Theorem above says that a real-valued fundamental set is

$$y_1(t) = e^t \cos(\sqrt{5} t), \qquad y_2(t) = e^t \sin(\sqrt{5} t).$$

- ロ ト - 4 回 ト - 4 □ - 4

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

Solution: Recall:  $y(t) = \tilde{c}_1 e^{(1+i\sqrt{5})t} + \tilde{c}_2 e^{(1-i\sqrt{5})t}$ ,  $\tilde{c}_1, \tilde{c}_2 \in \mathbb{C}$ . The Theorem above says that a real-valued fundamental set is  $y_1(t) = e^t \cos(\sqrt{5}t), \qquad y_2(t) = e^t \sin(\sqrt{5}t).$ 

Hence, the complex-valued general solution can also be written as

$$y(t) = \left[c_1\cos(\sqrt{5} t) + c_2\sin(\sqrt{5} t)\right]e^t, \qquad c_1, c_2 \in \mathbb{C}.$$

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

Solution: Recall:  $y(t) = \tilde{c}_1 e^{(1+i\sqrt{5})t} + \tilde{c}_2 e^{(1-i\sqrt{5})t}$ ,  $\tilde{c}_1, \tilde{c}_2 \in \mathbb{C}$ . The Theorem above says that a real-valued fundamental set is  $y_1(t) = e^t \cos(\sqrt{5}t), \qquad y_2(t) = e^t \sin(\sqrt{5}t).$ 

Hence, the complex-valued general solution can also be written as

$$y(t) = \left[c_1 \cos(\sqrt{5} t) + c_2 \sin(\sqrt{5} t)\right] e^t, \qquad c_1, c_2 \in \mathbb{C}.$$

The real-valued general solution is simple to obtain:

$$y(t) = \left[c_1\cos(\sqrt{5} t) + c_2\sin(\sqrt{5} t)\right]e^t, \qquad c_1, c_2 \in \mathbb{R}.$$

### Example

Find the real-valued general solution of the equation

$$y^{\prime\prime}-2y^{\prime}+6y=0.$$

Solution: Recall:  $y(t) = \tilde{c}_1 e^{(1+i\sqrt{5})t} + \tilde{c}_2 e^{(1-i\sqrt{5})t}$ ,  $\tilde{c}_1, \tilde{c}_2 \in \mathbb{C}$ . The Theorem above says that a real-valued fundamental set is  $y_t(t) = e^t \cos(\sqrt{5}t)$   $y_0(t) = e^t \sin(\sqrt{5}t)$ 

$$y_1(r) = r_1(r) + r_2(r)$$

Hence, the complex-valued general solution can also be written as

$$y(t) = \left[c_1 \cos(\sqrt{5} t) + c_2 \sin(\sqrt{5} t)\right] e^t, \qquad c_1, c_2 \in \mathbb{C}.$$

The real-valued general solution is simple to obtain:

$$y(t) = \left[c_1 \cos(\sqrt{5} t) + c_2 \sin(\sqrt{5} t)\right] e^t, \qquad c_1, c_2 \in \mathbb{R}.$$

We just restricted the coefficients  $c_1$ ,  $c_2$  to be real-valued.

### Example

Find real-valued fundamental solutions to the equation

$$y'' + 2y' + 6y = 0.$$
  
Solution:  $y_1(t) = e^{-t} \cos(\sqrt{5}t), \ y_2(t) = e^{-t} \sin(\sqrt{5}t).$ 

Differential equations like the one in this example describe physical processes related to damped oscillations. For example pendulums with friction.

Therefore,  $r_{\pm} = -\alpha \pm i\sqrt{\omega^2 - \alpha^2}$ .

#### Example

Find real-valued fundamental solutions to  $I'' + 2\alpha I' + \omega^2 I = 0$ , where  $\alpha = R/(2L)$ ,  $\omega^2 = 1/(LC)$ , in the cases (a) (b) below.

Solution: Recall:  $r_{\pm} = -\alpha \pm \sqrt{\alpha^2 - \omega^2}$ .

Case (b)  $R < \sqrt{4L/C}$ . This implies

$$R^2 < \frac{4L}{C} \quad \Leftrightarrow \quad \frac{R^2}{4L^2} < \frac{1}{LC} \quad \Leftrightarrow \quad \alpha^2 < \omega^2.$$

Therefore,  $r_{\pm} = -\alpha \pm i\sqrt{\omega^2 - \alpha^2}$ . The fundamental solutions are
