

# Exact differential equations.

### Definition

The differential equation in the unknown function  $y:(t_1,t_2) \to \mathbb{R}$ 

$$N(t, y(t)) y'(t) + M(t, y(t)) = 0$$

is called *exact* in an open rectangle  $R = (t_1, t_2) \times (u_1, u_2) \subset \mathbb{R}^2$  iff for every point  $(t, u) \in R$  the functions  $M, N : R \to \mathbb{R}$  are continuously differentiable and satisfy the equation

$$\partial_t N(t,u) = \partial_u M(t,u)$$

Remark: We use the notation:  $\partial_t N = \frac{\partial N}{\partial t}$ , and  $\partial_u M = \frac{\partial M}{\partial u}$ .

## Exact differential equations.

## Example

Show whether the differential equation below is exact,

$$2ty(t) y'(t) + 2t + y^2(t) = 0.$$

Solution: We first identify the functions N and M,

$$\begin{bmatrix} 2ty(t) \end{bmatrix} y'(t) + \begin{bmatrix} 2t + y^2(t) \end{bmatrix} = 0 \quad \Rightarrow \quad \begin{cases} N(t, u) = 2tu, \\ M(t, u) = 2t + u^2. \end{cases}$$

The equation is exact iff  $\partial_t N = \partial_u M$ . Since

$$N(t, u) = 2tu \quad \Rightarrow \quad \partial_t N(t, u) = 2u,$$

$$M(t, u) = 2t + u^2 \quad \Rightarrow \quad \partial_u M(t, u) = 2u.$$

We conclude:  $\partial_t N(t, u) = \partial_u M(t, u)$ .

Remark: The ODE above is not separable and non-linear.

# Exact differential equations.

## Example

Show whether the differential equation below is exact,

$$\sin(t)y'(t) + t^2 e^{y(t)}y'(t) - y'(t) = -y(t)\cos(t) - 2t e^{y(t)}$$

Solution: We first identify the functions N and M, if we write

$$\left[\sin(t) + t^2 e^{y(t)} - 1\right] y'(t) + \left[y(t)\cos(t) + 2t e^{y(t)}\right] = 0,$$

we can see that

$$\begin{split} N(t,u) &= \sin(t) + t^2 e^u - 1 \quad \Rightarrow \quad \partial_t N(t,u) = \cos(t) + 2t e^u, \\ M(t,u) &= u \cos(t) + 2t e^u \quad \Rightarrow \quad \partial_u M(t,u) = \cos(t) + 2t e^u. \\ \text{The equation is exact, since } \partial_t N(t,u) &= \partial_u M(t,u). \quad \vartriangleleft \end{split}$$

$$\triangleleft$$

# Exact differential equations.

### Example

Show whether the linear differential equation below is exact,

$$y'(t) = -a(t)y(t) + b(t), \qquad a(t) \neq 0.$$

Solution: We first find the functions N and M,

$$y'+a(t)y-b(t)=0 \quad \Rightarrow \quad \left\{ egin{array}{l} N(t,u)=1, \ M(t,u)=a(t)\,u-b(t). \end{array} 
ight.$$

The differential equation is not exact, since

$$N(t, u) = 1 \quad \Rightarrow \quad \partial_t N(t, u) = 0,$$

$$M(t,u) = a(t)u - b(t) \quad \Rightarrow \quad \partial_u M(t,u) = a(t).$$

 $\triangleleft$ 

This implies that  $\partial_t N(t, u) \neq \partial_u M(t, u)$ .

# Exact equations (Sect. 1.4).

- Exact differential equations.
- ► The Poincaré Lemma.
- Implicit solutions and the potential function.
- Generalization: The integrating factor method.

# The Poincaré Lemma.

Remark: The coefficients N and M of an exact equations are the derivatives of a potential function  $\psi$ .

Lemma (Poincaré)

Continuously differentiable functions  $M, N : R \to \mathbb{R}$ , on an open rectangle  $R = (t_1, t_2) \times (u_1, u_2) \subset \mathbb{R}^2$ , satisfy the equation

 $\partial_t N(t, u) = \partial_u M(t, u)$ 

iff there exists a twice continuously differentiable function  $\psi : R \to \mathbb{R}$ , called potential function, such that for all  $(t, u) \in R$  holds

 $\partial_u \psi(t, u) = N(t, u), \qquad \partial_t \psi(t, u) = M(t, u).$ 

Proof: (
$$\Leftarrow$$
) Simple:  $\begin{cases} \partial_t N = \partial_t \partial_u \psi, \\ \partial_u M = \partial_u \partial_t \psi, \end{cases} \Rightarrow \partial_t N = \partial_u M.$ 

 $(\Rightarrow)$  Difficult: Poincaré, 1880.

# The Poincaré Lemma.

### Example

Show that the function  $\psi(t, u) = t^2 + tu^2$  is the potential function for the exact differential equation

$$2ty(t) y'(t) + 2t + y^2(t) = 0.$$

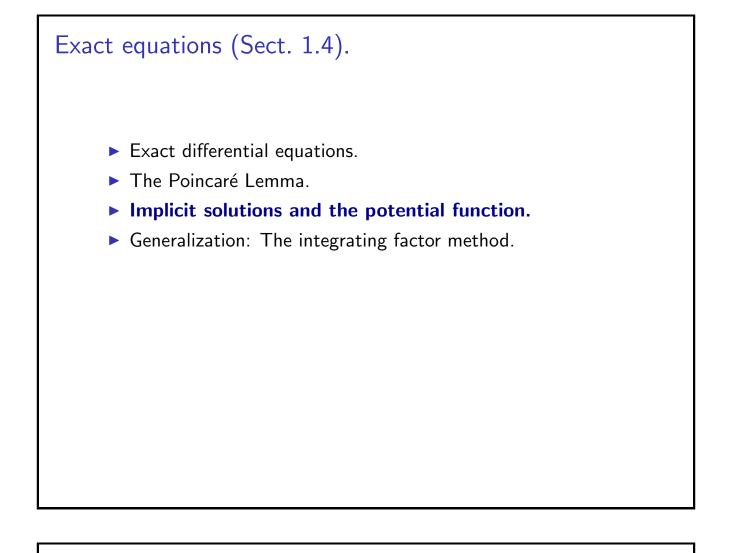

Solution: We already saw that the differential equation above is exact, since the functions M and N,

$$\begin{array}{l} N(t,u) = 2tu, \\ M(t,u) = 2t + u^2 \end{array} \} \quad \Rightarrow \quad \partial_t N = 2u = \partial_u M. \end{array}$$

The potential function is  $\psi(t, u) = t^2 + tu^2$ , since

$$\partial_t \psi = 2t + u^2 = M, \qquad \partial_u \psi = 2tu = N.$$

Remark: The Poincaré Lemma only states necessary and sufficient conditions on N and M for the existence of  $\psi$ .

Implicit solutions and the potential function.

Theorem (Exact differential equations) If the differential equation

$$N(t, y(t)) y'(t) + M(t, y(t)) = 0$$
(1)

is exact on  $R = (t_1, t_2) \times (u_1, u_2)$ , then every solution y must satisfy the algebraic equation

 $\psi(t, y(t)) = c,$ 

where  $c \in \mathbb{R}$  and  $\psi : R \to \mathbb{R}$  is a potential function for Eq. (??).

Proof: 
$$0 = N(t, y) y' + M(t, y) = \partial_y \psi(t, y) \frac{dy}{dt} + \partial_t \psi(t, y)).$$
  
$$0 = \frac{d}{dt} \psi(t, y(t)) \quad \Leftrightarrow \quad \psi(t, y(t)) = c.$$

## Implicit solutions and the potential function.

## Example

Find all solutions y to the equation

$$\left[\sin(t) + t^2 e^{y(t)} - 1\right] y'(t) + y(t) \cos(t) + 2t e^{y(t)} = 0.$$

Solution: Recall: The equation is exact,

 $N(t, u) = \sin(t) + t^2 e^u - 1 \quad \Rightarrow \quad \partial_t N(t, u) = \cos(t) + 2t e^u,$ 

$$M(t, u) = u\cos(t) + 2te^u \quad \Rightarrow \quad \partial_u M(t, u) = \cos(t) + 2te^u,$$

hence,  $\partial_t N = \partial_u M$ . Poincaré Lemma says the exists  $\psi$ ,

$$\partial_u \psi(t, u) = N(t, u), \quad \partial_t \psi(t, u) = M(t, u).$$

These are actually equations for  $\psi$ . From the first one,

$$\psi(t,u) = \int \left[\sin(t) + t^2 e^u - 1\right] du + g(t).$$

## Implicit solutions and the potential function.

#### Example

Find all solutions y to the equation

$$\left[\sin(t) + t^2 e^{y(t)} - 1\right] y'(t) + y(t) \cos(t) + 2t e^{y(t)} = 0.$$

Solution:  $\psi(t, u) = \int [\sin(t) + t^2 e^u - 1] du + g(t)$ . Integrating,  $\psi(t, u) = u \sin(t) + t^2 e^u - u + g(t)$ .

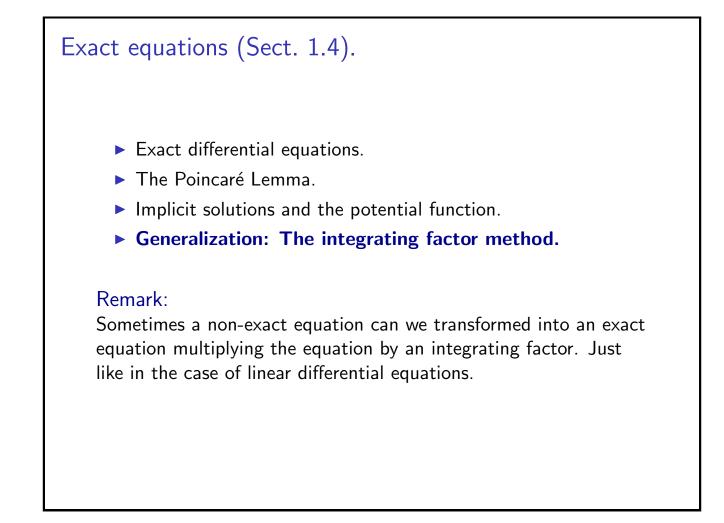

Introduce this expression into  $\partial_t \psi(t, u) = M(t, u)$ , that is,

$$\partial_t \psi(t, u) = u \cos(t) + 2te^u + g'(t) = M(t, u) = u \cos(t) + 2te^u,$$

Therefore, g'(t) = 0, so we choose g(t) = 0. We obtain,

$$\psi(t,u)=u\sin(t)+t^2e^u-u.$$

So the solution y satisfies  $y(t)\sin(t) + t^2e^{y(t)} - y(t) = c$ .

Generalization: The integrating factor method.

Theorem (Integrating factor)

Assume that the differential equation

N(t, y(t)) y'(t) + M(t, y(t)) = 0

is not exact in the sense that the continuously differentiable functions  $M, N : R \to \mathbb{R}$  satisfy  $\partial_t N(t, u) \neq \partial_u M(t, u)$  on  $R = (t_1, t_2) \times (u_1, u_2)$ . If  $N \neq 0$  and the function

$$\frac{1}{N(t,u)} \big[ \partial_u M(t,u) - \partial_t N(t,u) \big]$$

does not depend on the variable u, then the equation

 $\mu(t) N(t, y(t)) y'(t) + \mu(t) M(t, y(t)) = 0$ 

is exact, where  $\frac{\mu'(t)}{\mu(t)} = \frac{1}{N(t,u)} [\partial_u M(t,u) - \partial_t N(t,u)].$ 

Generalization: The integrating factor method. Example Find all solutions y to the differential equation  $[t^2 + ty(t)]y'(t) + [3ty(t) + y^2(t)] = 0.$ Solution: The equation is not exact:  $N(t, u) = t^2 + tu \Rightarrow \partial_t N(t, u) = 2t + u,$   $M(t, u) = 3tu + u^2 \Rightarrow \partial_u M(t, u) = 3t + 2u,$ hence  $\partial_t N \neq \partial_u M$ . We now verify whether the extra condition in Theorem above holds:  $\frac{[\partial_u M(t, u) - \partial_t N(t, u)]}{N(t, u)} = \frac{1}{(t^2 + tu)}[(3t + 2u) - (2t + u)]$  $\frac{[\partial_u M(t, u) - \partial_t N(t, u)]}{N(t, u)} = \frac{1}{t(t + u)}(t + u) = \frac{1}{t}.$ 

Generalization: The integrating factor method.

### Example

Find all solutions y to the differential equation

$$[t^{2} + t y(t)] y'(t) + [3t y(t) + y^{2}(t)] = 0.$$

Solution: 
$$\frac{\left[\partial_u M(t,u) - \partial_t N(t,u)\right]}{N(t,u)} = \frac{1}{t}$$

We find a function  $\mu$  solution of  $\frac{\mu'}{\mu} = \frac{\left[\partial_u M - \partial_t N\right]}{N}$ , that is

$$rac{\mu'(t)}{\mu(t)}=rac{1}{t}$$
  $\Rightarrow$   $\ln(\mu(t))=\ln(t)$   $\Rightarrow$   $\mu(t)=t.$ 

Therefore, the equation below is exact:

$$\left[t^{3}+t^{2} y(t)\right] y'(t)+\left[3t^{2} y(t)+t y^{2}(t)\right]=0.$$

Generalization: The integrating factor method. Example Find all solutions y to the differential equation  $[t^2 + ty(t)]y'(t) + [3ty(t) + y^2(t)] = 0.$ Solution:  $[t^3 + t^2y(t)]y'(t) + [3t^2y(t) + ty^2(t)] = 0.$ This equation is exact:  $\tilde{N}(t, u) = t^3 + t^2u \implies \partial_t \tilde{N}(t, u) = 3t^2 + 2tu,$   $\tilde{M}(t, u) = 3t^2u + tu^2 \implies \partial_u \tilde{M}(t, u) = 3t^2 + 2tu,$ that is,  $\partial_t \tilde{N} = \partial_u \tilde{M}$ . Therefore, there exists  $\psi$  such that  $\partial_u \psi(t, u) = \tilde{N}(t, u), \qquad \partial_t \psi(t, u) = \tilde{M}(t, u).$ From the first equation above we obtain  $\partial_u \psi = t^3 + t^2u \implies \psi(t, u) = \int (t^3 + t^2u) du + g(t).$ 

Generalization: The integrating factor method.

### Example

Find all solutions y to the differential equation

$$[t^{2} + t y(t)] y'(t) + [3t y(t) + y^{2}(t)] = 0.$$

Solution:  $\psi(t, u) = \int (t^3 + t^2 u) du + g(t).$ 

Integrating,  $\psi(t, u) = t^3 u + \frac{1}{2} t^2 u^2 + g(t)$ . Introduce  $\psi$  in  $\partial_t \psi = \tilde{M}$ , where  $\tilde{M} = 3t^2 u + tu^2$ . So,

$$\partial_t \psi(t, u) = 3t^2 u + tu^2 + g'(t) = \tilde{M}(t, u) = 3t^2 u + tu^2,$$

So g'(t) = 0 and we choose g(t) = 0. We conclude that a potential function is  $\psi(t, u) = t^3 u + \frac{1}{2} t^2 u^2$ . And every solution y satisfies  $t^3 y(t) + \frac{1}{2} t^2 [y(t)]^2 = c$ .

 $\triangleleft$
