Flow Polytopes

Integral (Convex) Polytopes

Definition

A compact subset $P \subseteq \mathbb{R}^n$ is a **convex polytope** if P can be written as

- 1 the intersection of finitely many half spaces, or
- 2 the convex hull of finitely many vertices

ON CERTAIN SUBGRAPHS OF A COMPLETE TRANSITIVELY DIRECTED GRAPH

E. ANDRESEN

Institute of Mathematics, University of Oslo, Oslo, Norway

K. KJELDSSEN

Headquarters Defence Command Norway, Oslo, Norway

Received 3 June 1974

Let G_n be a complete transitively directed graph with $n + 1$ vertices v_0, v_1, \dots, v_n . Let $\psi(n)$ be the number of subgraphs H of G_n where each vertex in H lies along a directed path from v_0 to v_n in H . $\psi(n)$ and some related quantities are calculated.

Remarks

- From Hille's theorem, the f -polynomial of a flow polytope is a generating function over the set of \mathbf{a} -valid subgraphs which keeps track of first Betti number.

Definition

The **primitive f -vector** of $\mathbf{Flow}_n(\mathbf{a})$, denoted $\tilde{f}^{(n)}(\mathbf{a})$ (or as $\tilde{f}^{(n)}(\mathbf{a}; x)$ if written as a polynomial) is a generating function over the set of \mathbf{a} -valid subgraphs of K_{n+1} that are primitive (use the entire vertex set) keeping track of the first Betti number.

Remarks

- Every non-negative netflow vector \mathbf{a} determines an integer composition $\text{revcomp}(\mathbf{a})$ as follows.
 - 1 Read the entries of \mathbf{a} from right to left
 - 2 Inductively create a block whenever a new nonzero entry is encountered
 - 3 Return the tuple of sizes coming from the list of blocks

Example

If $\mathbf{a} = (1, 1, 0, 0, 1, 0, 1, 0)$, we get blocks $(0, 1)$, $(0, 1)$, $(0, 0, 1)$, and (1) . Hence $\text{revcomp}(\mathbf{a}) = (2, 2, 3, 1)$.

$$x \cdot f^{(n)}(x) = (1 + x)^{n-1} \tilde{f}^{(n)}(x). \quad (5)$$

where the **primitive f -vector**, $\tilde{f}^{(n)}(x)$, enumerates subgraphs having all vertices v_1, \dots, v_{n+1} in a single connected component.

- We believe this formula may lead to an understanding of the face lattice of CRY_n , which is current work in progress.

Another relationship between $f(x)$ and $\tilde{f}(x)$

Theorem (D. 2024)

For all $n \geq 1$, the f -vector and primitive f -vector of CRY_n are related as:

$$x \cdot f^{(n)}(x) = (1 + x)^{n-1} \tilde{f}^{(n)}(x). \quad (5)$$

where the **primitive f -vector**, $\tilde{f}^{(n)}(x)$, enumerates subgraphs having all vertices v_1, \dots, v_{n+1} in a single connected component.

- We believe this formula may lead to an understanding of the face lattice of CRY_n , which is current work in progress.
- We are also now working to extend our results to various families of subgraphs of K_{n+1} .
