Summary: If I and J are ideals of a C^* -algebra A, then

Groupoids an ideals Relative

Pullback

diagrams of relative Toeplitz graph algebras

Introduction

pushouts, and pullbacks is a pullback diagram of C*-algebras if and only if $IJ(= I \cap J) = \{0\}.$

Motivation

Pullback diagrams of relative Toeplitz graph algebras

S. Brooker

Introduction

Graph Algebras Graphs Paths Various graph algebras

Ideals

The graph groupoid G(E) Groupoids and ideals

Relative graphs, pushouts and pullbacks In a recent paper [3], Hajac, Reznikoff, and Tobolski provide conditions they call *admissibility* on a decomposition of a directed graph *E* into a pair of subgraphs (F_1 , F_2) that imply that the *Cuntz-Krieger graph* C^{*}-algebras of the three graphs fit into a pullback diagram that is dual to the pushout diagram of the underlying graphs:

S. Brooker

Introduction

Graph Algebras Graphs Paths Various grap algebras

Ideals

The graph groupoid G(E) Groupoids and ideals

Relative graphs, pushouts, and pullbacks The algebras of the subgraphs considered in [3] are quotients of $C^*(E)$ by gauge-invariant ideals. However, such quotients cannot always be realized as Cuntz-Krieger algebras of subgraphs.

Spielberg introduced *Relative Toeplitz graph algebras* to describe subalgebras corresonding to subgraphs [9], but they also arise as *quotients* by gauge-invariant ideals that correspond to subgraphs.

Definition 2

A directed graph is a quadruple $E = (E^0, E^1, r, s)$

- *E*⁰ is the set of vertices
- *E*¹ is the set of directed edges
- r, s : E¹ → E⁰ are the range and source maps, respectively, so that if e ∈ E¹ is an edge from v to w

then r(e) = w and s(e) = v.

Notation: For $v \in E^0$, write

$$vE^1 = \{e \in E^1 : r(e) = v\} = r^{-1}(v)$$

and similarly, $E^1 v$ for $s^{-1}(v)$.

Definition 3

- Denote by E^* the collection of finite paths in $E: \alpha \in E^*$ means $\alpha = e_1 e_2 \cdots e_n$, where $e_1, \ldots, e_n \in E^1$ and $s(e_i) = r(e_{i+1})$ for $1 \le i < n$: $r(\alpha) := r(e_1) \xleftarrow{e_1} \xleftarrow{e_2} \xleftarrow{\cdots} \xleftarrow{e_n} s(e_n) =: s(\alpha)$
- Let E^{∞} be the set of all (semi) infinite paths in $E: x \in E^{\infty}$ means that $x = e_1 e_2 \cdots$ where $s(e_i) = r(e_{i+1})$ for $i \ge 1$:

$$r(x) := r(e_1) \xleftarrow{e_1} \xleftarrow{e_2} \xleftarrow{e_3} \cdots$$

For $\alpha \in E^*$, write $\alpha E^* = \{\alpha\beta : \beta \in E^*, r(\beta) = s(\alpha)\}$. The sets $E^*\alpha$, αE^{∞} , and E^*x for $x \in E^{\infty}$ are defined similarly.

A graph algebra: $\mathcal{T}C^*(E)$

< □ > < □ > = ∽ < 8/24

Definition 4

Let *E* be a (directed) graph. The *Toeplitz graph algebra* $\mathcal{T}C^*(E)$ is the universal *C*^{*}-algebra generated by a set of mutually orthogonal projections $\{P_v : v \in E^0\}$ and a set of partial isometries $\{S_e : e \in E^1\}$ satisfying the following relations:

- for all $e \in E^1$, $S_e^*S_e = P_{s(e)}$
- for all $e, f \in E^1$, if $e \neq f$ then $S_e^*S_f = 0$
- for all $e \in E^1$, $P_{r(e)}S_e = S_e$

The graph algebra, $C^*(E)$

Definition 5

Pullback

diagrams of relative Toeplitz graph algebras

S. Brooker

Various graph algebras A vertex v in a graph E is called *singular* if it is a *source*, $|vE^1| = 0$, or an *infinite receiver*, $|vE^1| = \infty$. Otherwise, v is called *regular*. We write reg(E) for the set of regular vetices in E.

Definition 6

Let *E* be a graph. The *Cuntz-Krieger algebra of E*, denoted $C^*(E)$, is defined as $\mathcal{T}C^*(E)$, but with the additional requirement that for all $v \in \operatorname{reg}(E)$, $P_v = \sum_{e \in vF^1} S_e S_e^*$.

The relation

$$P_v = \sum_{e \in vE^1} S_e S_e^*$$

is called the Cuntz-Krieger relation at v.

Gauge-invariant ideals of graph algebras

Definition 8

- Let E be a graph. A set H ⊆ E⁰ is called *hereditary* if for any e ∈ HE¹, s(e) ∈ H.
- For a hereditary set H ⊆ E⁰, we define a subgraph F_H of E by F⁰_H = E⁰ \ H, F¹_H = E¹F⁰_H.

Note that
$$F_H^1 = E^1 F_H^0 = F_H^0 E^1 F_H^0$$
, since H is hereditary.

Theorem 9 [8]

The gauge-invariant ideals of $\mathcal{T}C^*(E)$ are parameterized by pairs (H, A) where H is a hereditary subset of E^0 and $A \subseteq reg(F_H)$.

Pullback

S. Brooker

Graph Algebras Graphs Paths Various graph algebras

Ideals

The graph groupoid G(E) Groupoids an

Relative graphs, pushouts, and pullbacks

Definition 10

A groupoid is a small category G in which every morphism has an inverse. Denote by $G^{(0)}$ the set of objects (identified with their identity morphisms), called *units*. For a general element $g \in G$, define range and source maps $r, s : G \to G^{(0)}$ by

$$r(g) = gg^{-1}, \quad s(g) = g^{-1}g.$$

Given a topological groupoid G, the (full) groupoid C^* -algebra $C^*(G)$ is built from *-representations of the convolution *-algebra $C_C(G)$ (see [5] for details).

The groupoid of a graph

We use the description from [10]. This is not the usual description.

Definition 11

Let *E* be a directed graph. The groupoid of *E*, G(E), is defined as follows:

- The unit space is G(E)⁽⁰⁾ = E[∞] ∪ E^{*}, the set of all infinite and finite paths in E.
- The elements of G(E) are equivalence classes of triples, written $[\alpha, \beta, x]$, where $\alpha, \beta \in E^*$, $x \in G(E)^{(0)}$, and $s(\alpha) = s(\beta) = r(x)$.

S. Brooker

Introduction

Graph Algebras Graphs Paths Various grap algebras

Ideals

The grapl groupoid G(E) Groupoids an

Relative graphs, pushouts, and pullbacks

Let $t = [\alpha, \beta, x] \in G(E)$.

Then $r(t) = [r(\alpha), r(\alpha), \alpha x] \equiv \alpha x$ and $s(t) = \beta x \in G(E)^{(0)}$.

What is $[\alpha, \beta, x] \in G(E)$?

This induces a basis of compact-open bisections for an LCH topology on the whole groupoid, with respect to which G(E) is an étale, amenable, locally compact, Hausdorff groupoid.

In [10] it is proven that $C^*(G(E)) \cong \mathcal{T}C^*(E)$. We use the groupoid picture to work with the gauge-invariant ideals of $\mathcal{T}C^*(E)$ and their quotients.

Groupoids and ideals

<□><□><□><□><□><□><□><□><□><□><□<</

Definition 12

Let G be a groupoid. A G-invariant (or just invariant) set is a subset $S \subseteq G^{(0)}$ such that

$$\forall t \in G, r(t) \in S \iff s(t) \in S.$$

For an invariant set S, we write S^C for the relative complement $G^{(0)} \setminus S$ of S in $G^{(0)}$. Note that $S \subseteq G^{(0)}$ is invariant if and only if S^C is invariant.

The gauge-invariant ideals of $\mathcal{T}C^*(E) = C^*(G(E))$ are given by the open G(E)-invariant sets $U \subseteq G(E)^{(0)}$: Given U, $G(E)|_U$ is a groupoid whose unit space is U, and we have the following short exact sequence:

$$0 \rightarrow C^*(G(E)|_U) \rightarrow C^*(G(E)) \rightarrow C^*(G(E)|_{U^C}) \rightarrow 0$$

Introduction

Graph Algebras Graphs Paths Various graph algebras

Ideals

The graph groupoid G(E) Groupoids and ideals

Relative graphs, pushouts, and pullbacks Earlier we said that the gauge-invariant ideals of $\mathcal{T}C^*(E)$ correspond to pairs (H, A) where $H \subseteq E^0$ is hereditary, and $A \subseteq \operatorname{reg}(F_H)$. Thus, each pair (H, A) corresponds to an open invariant set $U(H, A) \subseteq G(E)^{(0)}$.

We give a description of the set U(H, A) in [2], and get the following:

Theorem 13 [2] (B-Spielberg 2022)

If $J_{H,A}$ is the ideal $C^*(G(E)|_{U(H,A)})$ of $C^*(G(E)) = \mathcal{T}C^*(E)$ corresponding to a hereditary set $H \subseteq E^0$ and a subset $A \subseteq \operatorname{reg}(F_H)$, then

$$\mathcal{T}C^*(E)/J_{H,A}\cong \mathcal{T}C^*(F_H,A).$$
