

#1. (24 pts) Find the following limits:

(a) (8 pts)  $\lim_{x \rightarrow 0} \frac{\sin 2x}{x} + \lim_{x \rightarrow \frac{\pi}{4}} \frac{\sin 2x}{x}$

(b) (8 pts)  $\lim_{x \rightarrow 1^-} (8x + 3) \frac{|x - 1|}{x - 1}$ .

(c) (8 pts)  $\lim_{x \rightarrow 0} \frac{x(\cos x - 1)}{\sin x - x}$  **(Ignore this part. It requires L'Hospital's Rule, which was not covered this year.)**

(a)

$$\lim_{x \rightarrow 0} \frac{\sin 2x}{x} + \lim_{x \rightarrow \frac{\pi}{4}} \frac{\sin 2x}{x} = \lim_{x \rightarrow 0} \left( \frac{\sin 2x}{2x} \cdot \frac{2x}{x} \right) + \frac{\sin(2 \cdot \frac{\pi}{4})}{\frac{\pi}{4}} = \left( \lim_{y \rightarrow 0} \frac{\sin y}{y} \right) \cdot 2 + \frac{4 \sin(\frac{\pi}{2})}{\pi} = 1 \cdot 2 + \frac{4 \cdot 1}{\pi} = \boxed{\frac{2\pi + 4}{\pi}}$$

(b) If  $x < 1$ , then  $x - 1 < 0$  and so  $|x - 1| = -(x - 1)$ . Hence

$$\lim_{x \rightarrow 1^-} (8x + 3) \frac{|x - 1|}{x - 1} = \lim_{x \rightarrow 1^-} (8x + 3) \frac{-(x - 1)}{x - 1} = \lim_{x \rightarrow 1^-} (8x + 3) \cdot (-1) = \lim_{x \rightarrow 1^-} -(8x + 3) = -(8 \cdot 1 + 3) = \boxed{-11}$$

(c) **(Ignore this solution, unless you happen to know L'Hospital's Rule)**

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{x(\cos x - 1)}{\sin x - x} &= \lim_{x \rightarrow 0} \frac{(x(\cos x - 1))'}{(\sin x - x)'} \\ &= \lim_{x \rightarrow 0} \frac{1(\cos x - 1) + x(-\sin x - 0)}{(\cos x - 1)} \\ &= \lim_{x \rightarrow 0} \frac{\cos x - 1 - x \sin x}{\cos x - 1} \\ &= \lim_{x \rightarrow 0} \frac{(\cos x - 1 - x \sin x)'}{(\cos x - 1)'} \\ &= \lim_{x \rightarrow 0} \frac{-\sin x - 0 - (1 \cdot \sin x + x \cos x)}{-\sin x} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin x + x \cos x}{\sin x} \\ &= \lim_{x \rightarrow 0} \frac{(2 \sin x + x \cos x)'}{(\sin x)'} \\ &= \lim_{x \rightarrow 0} \frac{(2 \cos x + 1 \cdot \cos x - x \sin x)'}{\cos x} \\ &= \lim_{x \rightarrow 0} \frac{3 \cos x - x \sin x}{\cos x} \\ &= \frac{3 \cos(0) - 0 \cdot \sin(0)}{\cos(0)} \\ &= \frac{3 \cdot 1}{1} \\ &= \boxed{3} \end{aligned}$$

#2. (24 pts) Find the derivative of the following functions (**do not simplify**):

(a) (8 pts)  $f(x) = \sin^2 x + \sin(x^2) + (x + 1) \cos x + \frac{\cos x}{x+1}$ .

(b) (8 pts)  $f(x) = \tan\left(\frac{1}{x} + \sqrt{1 - \sqrt{x}}\right)$

(c) (8 pts)  $f(x) = \int_x^{x^2} \sqrt{1 + t^3} dt + \int (x^{2008} + 1)^{88} dx$

(a)

$$\begin{aligned} & \left( \sin^2 x + \sin(x^2) + (x+1)\cos x + \frac{\cos x}{x+1} \right)' \\ &= 2\sin x \cos x + \cos(x^2) \cdot 2x + 1 \cdot \cos x + (x+1)(-\sin x) + \frac{(-\sin x)(x+1) - \cos x \cdot 1}{(x+1)^2} \end{aligned}$$

(b)

$$\left( \tan\left(\frac{1}{x} + \sqrt{1 - \sqrt{x}}\right) \right)' = \sec^2\left(\frac{1}{x} + \sqrt{1 - \sqrt{x}}\right) \left( -\frac{1}{x^2} + \frac{1}{2\sqrt{1 - \sqrt{x}}} \cdot -\frac{1}{2\sqrt{x}} \right)$$

(c)

$$\left( \int_x^{x^2} \sqrt{1 + t^3} dt + \int (x^{2008} + 1)^{88} dx \right)' = \sqrt{1 + (x^2)^3} \cdot 2x - \sqrt{1 + x^3} + (x^{2008} + 1)^{88}$$

#3. (12 pts) Use the *definition* of the derivative as a *limit* to calculate  $f'(x)$  for  $f(x) = \frac{1}{x}$ . (There will be no credit for other methods).

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{\frac{1}{x+h} - \frac{1}{x}}{h} \\ &= \lim_{h \rightarrow 0} \frac{x - (x+h)}{h(x+h)x} \\ &= \lim_{h \rightarrow 0} \frac{-h}{h(x+h)x} \\ &= \lim_{h \rightarrow 0} \frac{-1}{(x+h)x} \\ &= \frac{-1}{(x+0)x} \\ &= -\frac{1}{x^2} \end{aligned}$$

#4. (15 pts)

(a) (10 pts) Let  $y$  be the implicit function of  $x$  determined by  $y^2 - 2x - 4y - 1 = 0$ . Find  $\frac{dy}{dx}$ .

(b) (5 pts) Using part (a), find the equation of the line tangent to the curve  $y^2 - 2x - 4y - 1 = 0$  at the point  $P(-2, 1)$ .

(a)

$$\begin{aligned} (y^2 - 2x - 4y - 1)' &= 0' \\ 2yy' - 2 - 4y' &= 0 \\ 2yy' - 4y' &= 2 \\ 2(y-2)y' &= 2 \\ (y-2)y' &= 1 \\ y' &= \boxed{\frac{1}{y-2}} \end{aligned}$$

(b) For  $x = -2$  and  $y = 1$  we get

$$y' = \frac{1}{y-2} = \frac{1}{1-2} = \frac{1}{-1} = -1.$$

So the tangent line has slope one and goes through the point  $P(-2, 1)$ . Hence the equation of the tangent line is

$$y - 1 = (-1)(x - (-2))$$

$$y - 1 = -x - 2$$

$$\boxed{y = -x - 1}$$

#5. (12 pts) When a circular plate of metal is heated in an oven, its radius increased at the rate of 0.01 cm/min. At what rate is the plate's area increasing when the radius is 10 cm?

Let  $A$  be the area of the plate and  $r$  the radius. We know that  $\frac{dr}{dt} = 0.01$  and need to compute  $\frac{dA}{dt}$  when  $r = 10$ .

$$A = \pi r^2$$

$$\frac{dA}{dt} = 2\pi r \frac{dr}{dt}$$

With  $r = 10$  and  $\frac{dr}{dt} = 0.01$  we get

$$\frac{dA}{dt} = 2\pi r \frac{dr}{dt} = 2\pi \cdot 10 \cdot 0.01 = \boxed{0.2\pi \frac{\text{cm}^2}{\text{min}}}$$

#6. (12 pts) A rock thrown vertically upward reaches a height of  $s = 24t - 0.8t^2$  meters in  $t$  seconds. How long does it take the rock to reach the highest point? And how high does the rock go?

$$v = s' = (24t - 0.8t^2)' = 24 - 1.6t$$

The rock reaches maximum height when  $v = 0$ :

$$0 = 24 - 1.6t$$
$$t = \frac{24}{1.6} = \frac{240}{16} = \frac{60}{4} = \boxed{15\text{sec}}$$

At  $t = 15$  the height is

$$s = 24t - 0.8t^2 = 24 \cdot 15 - 0.8 \cdot 15^2 = (24 - 0.8 \cdot 15) \cdot 15 = (24 - 12) \cdot 15 = 12 \cdot 15 = \boxed{180\text{m}}.$$

#7. (32 pts) Evaluate the following integrals:

(a) (8 pts)  $\int_1^4 \left( 2x - \frac{1}{\sqrt{x}} \right) dx.$

(b) (8 pts)  $\int_0^{\frac{\pi^2}{4}} \frac{\sin \sqrt{x} \cos \sqrt{x}}{2\sqrt{x}} dx$

(c) (8 pts)  $\int_0^\pi \frac{1}{2}(\cos x + |\cos x|) dx$

(d) (8 pts)  $\int t^{-2} \sin \left( 1 + \frac{1}{t} \right) dt$

(a)

$$\int_1^4 \left( 2x - \frac{1}{\sqrt{x}} \right) dx = [x^2 - 2\sqrt{x}]_1^4 = (4^2 - 2\sqrt{4}) - (1^2 - 2\sqrt{1}) = (16 - 2 \cdot 2) - (1 - 2) = 12 - (-1) = \boxed{13}$$

(b)  $\int_0^{\frac{\pi^2}{4}} \frac{\sin \sqrt{x} \cos \sqrt{x}}{2\sqrt{x}} dx = ?$

$$u = \sin(\sqrt{x})$$

$$du = (\sin(\sqrt{x}))' dx = \cos(\sqrt{x}) \frac{1}{2\sqrt{x}} dx = \frac{\cos(\sqrt{x})}{2\sqrt{x}}$$

$$x = \frac{\pi^2}{4} : u = \sin(\sqrt{\frac{\pi^2}{4}}) = \sin(\frac{\pi}{2}) = 1$$

$$x = 0 : u = \sin(\sqrt{0}) = \sin 0 = 0.$$

$$\begin{aligned} \int_0^{\frac{\pi^2}{4}} \frac{\sin \sqrt{x} \cos \sqrt{x}}{2\sqrt{x}} dx &= \int_0^{\frac{\pi^2}{4}} \sin \sqrt{x} \frac{\cos \sqrt{x}}{2\sqrt{x}} dx \\ &= \int_0^1 u du \\ &= \left[ \frac{1}{2} u^2 \right]_0^1 \\ &= \frac{1}{2} 1^2 - \frac{1}{2} 0^2 \\ &= \boxed{\frac{1}{2}} \end{aligned}$$

(c) If  $x$  is in  $[0, \frac{\pi}{2}]$ , then  $\cos x \geq 0$  and so  $|\cos x| = \cos x$ .

If  $x$  is in  $[\frac{\pi}{2}, \pi]$ , then  $\cos x \leq 0$  and so  $|\cos x| = -\cos x$ . Thus

$$\begin{aligned} \int_0^{\pi} \frac{1}{2} (\cos x + |\cos x|) dx &= \int_0^{\frac{\pi}{2}} \frac{1}{2} (\cos x + |\cos x|) dx + \int_{\frac{\pi}{2}}^{\pi} \frac{1}{2} (\cos x + |\cos x|) dx \\ &= \int_0^{\frac{\pi}{2}} \frac{1}{2} (\cos x + \cos x) dx + \int_{\frac{\pi}{2}}^{\pi} \frac{1}{2} (\cos x - \cos x) dx \\ &= \int_0^{\frac{\pi}{2}} \cos x dx + \int_{\frac{\pi}{2}}^{\pi} 0 dx \\ &= [\sin x]_0^{\frac{\pi}{2}} + 0 \\ &= \sin\left(\frac{\pi}{2}\right) - \sin 0 \\ &= 1 - 0 \\ &= \boxed{1} \end{aligned}$$

#8. (10 pts) Find the linearization of the function  $f(x) = \sqrt{x}$  at the point  $a = 25$ . Then, using this linearization, estimate  $\sqrt{25.2}$ . (No credit will be given for any other methods.) Recall that

$$L(x) = f(a) + f'(a)(x - a).$$

We compute

$$f(a) = \sqrt{25} = 5.$$

$$f'(x) = (\sqrt{x})' = \frac{1}{2\sqrt{x}}$$

$$f'(a) = \frac{1}{2\sqrt{25}} = \frac{1}{10}$$

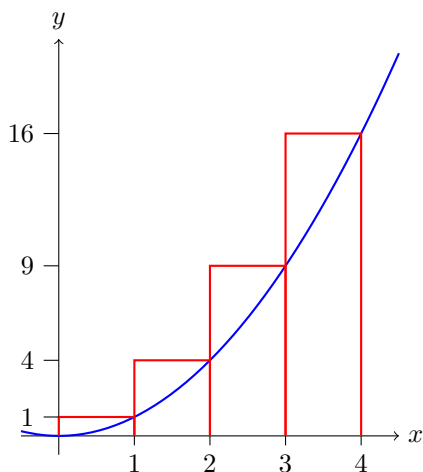

and so

$$L(x) = f(a) + f'(a)(x - a) = \boxed{5 + \frac{1}{10}(x - 25)}.$$

Thus

$$\sqrt{25.2} \approx L(25.2) = 5 + \frac{1}{10}(25.2 - 25) = 5 + \frac{1}{10} \cdot 0.2 = 5 + 0.02 = \boxed{5.02}.$$

#9. (10 pts) Consider  $f(x) = x^2$  for  $x \in [0, 4]$ . Sketch the rectangles associated with the upper sum of  $f(x)$  over  $[0, 4]$  by dividing the interval into four sub-intervals with equal length, and find this upper sum.

$$\text{Upper sum} = 1^2 \cdot 1 + 2^2 \cdot 1 + 3^2 \cdot 1 + 4^2 \cdot 1 = 1 + 4 + 9 + 16 = 5 + 25 = \boxed{30}$$

Alternatively, we could use the formula  $\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}$ :

$$\text{Upper sum} = \sum_{i=1}^4 i^2 \cdot 1 = \frac{4 \cdot (4+1) \cdot (2 \cdot 4 + 1)}{6} = \frac{4 \cdot 5 \cdot 9}{6} = 2 \cdot 5 \cdot 3 = 30.$$

#10. (24 pts) Let  $y = f(x) = \frac{x^2+3x-3}{x-1}$ .

- (a) (2 pts) Given that we can write the function as  $y = f(x) = x + 4 + \frac{1}{x-1}$ . Indicate the vertical asymptote of  $y = f(x)$ , and the oblique asymptote of  $y = f(x)$  as well. (**No** technical details are needed to justify your answer.)
- (b) (6 pts) Find the intervals where  $f(x)$  is increasing and the intervals where  $f(x)$  is decreasing. Identify the points where  $f(x)$  has a local maximum and the points where  $f(x)$  has a local minimum. (It is helpful to use the form  $y = f(x) = x + 4 + \frac{1}{x-1}$  to evaluate  $f'(x)$ .)
- (c) (10 pts) Find the intervals on which  $f(x)$  is concave-up and the intervals on which  $f(x)$  is concave-down.
- (d) (6 pts) Sketch the graph  $y = f(x)$  using the information from parts (a)-(c).

(a) From  $f(x) = x + 4 + \frac{1}{x-1}$  we see that  $\boxed{x=1}$  is a vertical asymptote and  $\boxed{y=x+4}$  is an oblique asymptote.

(b)

$$f'(x) = \left(x + 4 + \frac{1}{x-1}\right)' = 1 - \frac{1}{(x-1)^2} = \frac{(x-1)^2 - 1}{(x-1)^2} = \frac{x^2 - 2x + 1 - 1}{(x-1)^2} = \frac{x^2 - 2x}{(x-1)^2} = \frac{x(x-2)}{(x-1)^2}.$$

Hence  $f'(x) = 0$  for  $x = 0$  and  $x = 2$ . Also  $f'(x)$  is not defined at  $x = 1$ .

|             | $(-\infty, 0)$ | $(0, 1)$   | $(1, 2)$   | $(2, \infty)$ |
|-------------|----------------|------------|------------|---------------|
| $x$         | -              | +          | +          | +             |
| $x - 2$     | -              | -          | -          | +             |
| $(x - 1)^2$ | +              | +          | +          | +             |
| $f'$        | +              | -          | -          | +             |
| $f$         | $\nearrow$     | $\searrow$ | $\searrow$ | $\nearrow$    |

Hence  $f$  is increasing on  $(-\infty, 0]$  and on  $[2, \infty)$ ; and  $f$  is decreasing on  $[0, 1)$  and on  $(1, 2]$ .

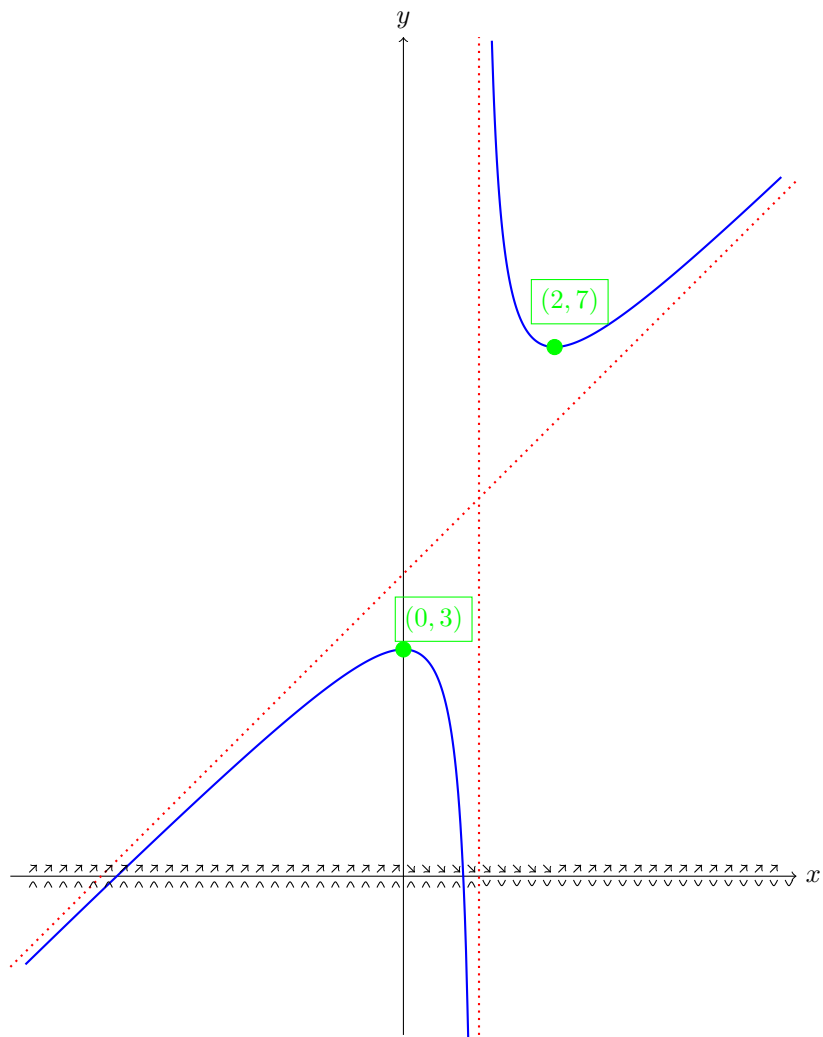

Moreover  $f$  has a local maximum at  $x = 0$  (with  $f(0) = \frac{-3}{-1} = 3$ ) and at  $x = 2$  (with  $f(2) = 2 + 4 + \frac{1}{2-1} = 6 + 1 = 7$ ).

(c)

$$f''(x) = \left(1 - \frac{1}{(x-1)^2}\right)' = 0 - (-2)\frac{1}{(x-1)^3} = \frac{2}{(x-1)^3}.$$

|             | $(-\infty, 1)$ | $(1, \infty)$ |
|-------------|----------------|---------------|
| $(x - 1)^3$ | -              | +             |
| $f''$       | -              | +             |
| $f$         | $\cap$         | $\cup$        |

Thus  $f$  is concave up on  $(1, \infty)$  and concave down on  $(-\infty, 1)$ .

- #11. (15 pts) You are designing a rectangular poster to contain  $50 \text{ in.}^2$  of printing with a 4-in. margin at the top and bottom and a 2-in. margin on each side. What overall dimension will minimize the amount of paper used. **Give an argument to show that your answer does give a minimum value.**

|     |     |     |
|-----|-----|-----|
|     | 4   | 4   |
| 2   | $x$ | 2   |
| $y$ |     | $y$ |
| 2   |     | 2   |
|     | $x$ |     |
|     | 4   | 4   |

We need to minimize the amount of paper  $A = (x + 4)(y + 8)$ .

We know that  $50 = \text{Area of the printing} = xy$ . So  $y = \frac{50}{x}$  and

$$A = (x + 4)\left(\frac{50}{x} + 8\right) = 50 + \frac{200}{x} + 8x + 32 = \frac{200}{x} + 8x + 82.$$

The domain for  $x$  is  $(0, \infty)$ . We compute

$$A' = \left(\frac{200}{x} + 8x + 82\right)' = -\frac{200}{x^2} + 8 = \frac{8x^2 - 200}{x^2} = 8\frac{x^2 - 25}{x^2}$$

$A'$  is defined for all  $x$  in the domain of  $(0, \infty)$  of  $x$ .  $A' = 0$  at  $x = 5$  (note that  $-5$  is not in the domain).

|            | $(0, 5)$   | $(5, \infty)$ |
|------------|------------|---------------|
| $x^2 - 25$ | −          | +             |
| $x^2$      | +          | +             |
| $f'$       | −          | +             |
| $f$        | $\searrow$ | $\nearrow$    |

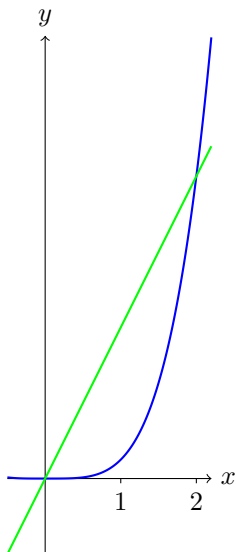

Hence  $A$  is decreasing on  $(0, 5)$  and increasing on  $(5, \infty)$ . Thus  $A$  has an absolute minimum at  $x = 5$ . If  $x = 5$ , then  $y = \frac{50}{x} = 10$  and the dimensions of the paper are

$$(5 + 4) \times (10 + 8) = \boxed{9\text{in} \times 18\text{in}}$$

#12. (10 pts) Find the area of the region enclosed by the curve  $y = x^4$  and the line  $y = 8x$ .

We will first sketch the graph of the two curves:

To find the intersection points:

$$\begin{aligned}x^4 &= 8x \\x^4 - 8x &= 0 \\x(x^3 - 8) &= 0\end{aligned}$$

So the intersection points are at  $x = 0$  and  $x = 2$ . From the picture we see that the larger function on the interval  $(0, 2)$  is  $8x$ . Thus

$$\begin{aligned}\text{Area} &= \int_0^2 (8x - x^4) dx \\&= \left[ 4x^2 - \frac{1}{5}x^5 \right]_0^2 \\&= \left[ \frac{20x^2 - x^5}{5} \right]_0^2 \\&= \frac{20 \cdot 2^2 - 2^5}{5} - 0 \\&= \frac{80 - 32}{5} \\&= \boxed{\frac{48}{5}}\end{aligned}$$
