

## § 4.5. Substitution Method

Key points: ① Differential Notation: If  $u = g(x)$ , then  $du = g'(x) \cdot dx$ .

$$\textcircled{2} \text{ u-Sub: } \int \underbrace{f(g(x))}_u \cdot \underbrace{g'(x) \cdot dx}_{du} \stackrel{u=g(x)}{du=g'(x)dx} \int f(u) \cdot du$$

• Goal of u-Substitution Method: By changing the variable  $x$  into  $u$ , we convert the integral into one of those five basic integrals which we can deal with.

• Basic integrals:  $\int x^n dx = \frac{1}{n+1} x^{n+1} + C$ ,  $\int \sin x dx = -\cos x + C$ ,  $\int \cos x dx = \sin x + C$

$$\int \sec^2 x dx = \tan x + C, \quad \int \sec x \cdot \tan x dx = \sec x + C.$$

① Differential Notation and Composition of functions.

eg. 1.  $u = x^2 + 1$ ,  $\frac{du}{dx} = (x^2 + 1)' = 2x \Rightarrow \boxed{du = 2x \cdot dx}$ .

eg. 2. If  $f(x) = \sqrt{x}$ , ~~then~~  $u = x^2 + 1$ , then  $f(u) = \sqrt{u} = \sqrt{x^2 + 1}$

② u-Sub method for indefinite integral

eg. 3. Evaluate  $\int \sqrt{u} \cdot du \stackrel{n=\frac{1}{2}}{=} \frac{1}{\frac{1}{2}+1} \cdot u^{\frac{1}{2}+1} + C = \boxed{\frac{2}{3} \cdot u^{\frac{3}{2}} + C}$

eg. 4.  $\int \sqrt{x^2 + 1} \cdot 2x \cdot dx$ .

$$= \int \sqrt{u} \cdot du.$$

$$= \frac{2}{3} \cdot u^{\frac{3}{2}} + C$$

$$= \frac{2}{3} (x^2 + 1)^{\frac{3}{2}} + C.$$

Set  $u = x^2 + 1$ , According to eg. 1.  $du = 2x \cdot dx$ .

Plug in  $u$  and  $du$ . By substituting  $u$  and  $du$  the integral of  $x$  turns into an integral of  $u$  with simpler form, which we evaluate in eg. 3.

Replace  $u$  by  $x^2 + 1$  in the last step.

• The key of u-sub is to find the right substitution u.

More examples:

eg 5. Evaluate  $\int x \cdot (2x^2+1)^3 \cdot dx$ . Hint:  $u=2x^2+1$  is the ugly part.  
(14 final)

$$u=2x^2+1, \quad du=4x \cdot dx \Rightarrow \boxed{x \cdot dx = \frac{1}{4} \cdot du}$$

$$= \int (2x^2+1)^3 \cdot x \cdot dx$$

$$= \int u^3 \cdot \frac{1}{4} \cdot du = \frac{1}{4} \cdot \frac{1}{3+1} \cdot u^{3+1} + C$$

$$= \frac{1}{16} \cdot u^4 + C = \boxed{\frac{1}{16}(2x^2+1)^4 + C}$$

eg 6. Evaluate  $\int \frac{\sec(\frac{x}{2}) \cdot \tan(\frac{x}{2})}{\sqrt{\sec(\frac{x}{2})}} \cdot dx$ . Hint:  $u=\sec(\frac{x}{2})$  is the ugly part.  
(14 final)

$$u = \sec\left(\frac{x}{2}\right), \quad du = \sec\left(\frac{x}{2}\right) \tan\left(\frac{x}{2}\right) \cdot \frac{1}{2} \cdot dx, \quad \text{chain rule for } (\sec \square)' = \sec \square \cdot \tan \square$$

$$\Rightarrow 2 du = \sec\left(\frac{x}{2}\right) \cdot \tan\left(\frac{x}{2}\right) \cdot dx$$

$$= \int \frac{2 du}{\sqrt{u}} = \int 2 \cdot u^{-\frac{1}{2}} du$$

$$= 2 \cdot \frac{1}{-\frac{1}{2}+1} \cdot u^{-\frac{1}{2}+1} + C$$

$$= 2 \cdot 2 \cdot u^{\frac{1}{2}} + C \xrightarrow{\text{back to } x} \boxed{4 \left(\sec\left(\frac{x}{2}\right)\right)^{\frac{1}{2}} + C}$$

• Linear substitution and more general form of the five basic integrals.

$$\star \int (ax+b)^n = \frac{1}{n+1} \cdot X^{n+1} + C, \quad \int \sin(ax+b) dx = -\frac{1}{a} \cos(ax+b) + C, \quad \int \cos(ax+b) dx = \frac{1}{a} \sin(ax+b) + C$$

$$\int \tan(ax+b) \cdot \sec(ax+b) \cdot dx = \frac{1}{a} \sec(ax+b) + C, \quad \int \sec^2(ax+b) dx = \frac{1}{a} \tan(ax+b) + C.$$

eg 7.  $\int \sin(1-2x) \cdot dx$   $\frac{u=1-2x}{du=-2dx}$   $\int \sin u \cdot \frac{du}{-2} = \frac{1}{-2} (-\cos u) + C = \boxed{\frac{-1}{-2} \cos(1-2x) + C}$   
 $\frac{du}{-2} = dx$

③ u-sub for definite integral.

eg. 8. Evaluate the definite integral  $\int_0^2 \frac{1}{\sqrt{9-4x}} dx$ .

Ugly part:  $9-4x$ .  $u=9-4x$ ,  $du=-4 \cdot dx \Rightarrow dx = \frac{du}{-4}$

Caution:  $\int_0^2$  0, 2 are for  $x$ . They also change as we substitute  $9-4x$  by  $u$ .

$$\int_{x=0}^{x=2} \xrightarrow{u=9-4x} \begin{matrix} u=9-4 \cdot 2=1 \\ u=9-4 \cdot 0=9 \end{matrix} \int_{u=9}^u=1$$

$$\int_0^2 \frac{1}{\sqrt{9-4x}} dx \xrightarrow{u=9-4x} \int_9^1 \frac{1}{\sqrt{u}} \cdot \frac{du}{-4} \quad \text{Use the flipping trick}$$

$$= \int_1^9 \frac{1}{4} \cdot u^{-\frac{1}{2}} du = \frac{1}{4} \cdot \frac{1}{\frac{1}{2}} u^{\frac{1}{2}} \Big|_1^9$$

$$= \frac{1}{2} \cdot \sqrt{u} \Big|_1^9 = \boxed{\frac{1}{2} \cdot \sqrt{9} - \frac{1}{2} \cdot \sqrt{1}} = \boxed{1}$$

eg. 9. Evaluate  $\int_0^{\frac{\pi}{2}} 3 \cdot \tan\left(\frac{x}{2}\right) \cdot \sec^2\left(\frac{x}{2}\right) dx$ . Hint:  $(\tan \theta)' = \sec^2 \theta$

$$u = \tan\left(\frac{x}{2}\right). \quad du = \frac{1}{2} \sec^2\left(\frac{x}{2}\right) dx. \quad \int_{x=0}^{x=\frac{\pi}{2}} \rightarrow \begin{matrix} u = \tan\left(\frac{\pi}{4}\right) = 1 \\ u = \tan 0 = 0 \end{matrix}$$

$$2 du = \sec^2\left(\frac{x}{2}\right) dx. \quad = \int_0^1 3 \cdot u \cdot 2 du = 6 \cdot \frac{1}{2} u^2 \Big|_0^1 = \boxed{3 \cdot 1^2 - 3 \cdot 0^2 = 3}$$

④ Symmetry integral.

If  $f(x)$  is odd, i.e.,  $f(-x) = -f(x)$ , then  $\int_{-a}^a f(x) dx = 0$

$f$  odd means the graph of  $f$  is symmetric about the origin. Then the area above and below  $x$ -axis are the same, which will be cancelled out.

eg. 10.  $f(x) = \sin x \cdot (x^2 + 1)$ .  $\int_{-8}^8 \sin x \cdot (x^2 + 1) dx = 0$

since  $f(-x) = \sin(-x) \cdot ((-x)^2 + 1) = -\sin x \cdot (x^2 + 1) = -f(x)$ . ( $\sin x$  is odd)

More examples and hints for u-substitution:

eg 11. (ww8).  $\int_8^{11} x \cdot \sqrt{x-7} dx$ . Hint:  $u = x-7$ .  $du = dx$ .

$$= \int x \cdot \sqrt{u} du$$

$$= \int (u+7) \cdot \sqrt{u} du$$

$$= \int_1^4 u u^{\frac{1}{2}} + 7 \cdot u^{\frac{1}{2}} du$$

$$= \int_1^4 u^{\frac{3}{2}} + 7 \cdot u^{\frac{1}{2}} du = \frac{2}{5} u^{\frac{5}{2}} + 7 \cdot \frac{2}{3} u^{\frac{3}{2}} \Big|_1^4$$

$$4^{\frac{5}{2}} = (\sqrt{4})^5 = 32$$

$$4^{\frac{3}{2}} = (\sqrt{4})^3 = 8$$

$$= \frac{2}{5} \cdot 4^{\frac{5}{2}} + \frac{14}{3} \cdot 4^{\frac{3}{2}} - \left( \frac{2}{5} \cdot 1 + \frac{14}{3} \cdot 1 \right)$$

$$= \frac{64}{5} + \frac{112}{3} - \frac{2}{5} - \frac{14}{3} = \boxed{\frac{62}{5} + \frac{98}{3}}$$

there is still one  $x$  left. keep substituting

via the relation  $u = x-7 \Leftrightarrow u+7 = x$ .

$$x=11 \rightarrow u = x-7 = 4$$

$$x=8 \rightarrow u = x-7 = 1$$

eg 12. (ww6)  $\int \frac{1}{x^2} \sin\left(\frac{3}{x}\right) \cdot \cos\left(\frac{3}{x}\right) dx$ . Hint:

$$= \int \cos\left(\frac{3}{x}\right) \cdot \frac{1}{x^2} \sin\left(\frac{3}{x}\right) dx$$

$$= \int u \cdot \frac{1}{2} du$$

$$= \frac{1}{2} \cdot \frac{1}{2} u^2 + C$$

$$= \boxed{\frac{1}{8} \cdot \left(\cos\left(\frac{3}{x}\right)\right)^2 + C}$$

$$u = \cos\left(\frac{3}{x}\right)$$

$$du = -\sin\left(\frac{3}{x}\right) \cdot \left(\frac{3}{x}\right)' dx$$

$$= -\sin\left(\frac{3}{x}\right) \cdot \frac{-3}{x^2} dx$$

$$= \sin\left(\frac{3}{x}\right) \cdot \frac{3}{x^2} dx$$

$$\Rightarrow \frac{1}{3} du = \sin\left(\frac{3}{x}\right) \cdot \frac{1}{x^2} dx$$

chain rule.

$$\text{inner } \frac{3}{x} = 3 \cdot x^{-1}$$

$$(3 \cdot x^{-1})' = 3 \cdot \frac{-1}{x^2}$$

eg 13.  $\int \frac{x^3}{\sqrt{1+2x^4}} dx$ .

(14 Final)

u-sub part:  $u = 1+2x^4$ ,  $du = 8 \cdot x^3 dx$

$$\Rightarrow \frac{1}{8} du = x^3 dx$$

$$= \int \frac{1}{\sqrt{u}} \cdot \frac{1}{8} du$$

$$= \int u^{-\frac{1}{2}} \cdot \frac{1}{8} du = \frac{1}{-\frac{1}{2}+1} u^{-\frac{1}{2}+1} \cdot \frac{1}{8} + C$$

$$= 2(u)^{\frac{1}{2}} \cdot \frac{1}{8} + C$$

$$= \frac{1}{4} \cdot (1+2x^4)^{\frac{1}{2}} + C$$
